Responsibility Tracker: Abstract(Title pending)

Guardians can't always watch their wards so the Responsibility Tracker makes it possible for them to do so. Over the past few months, there has been much talk and debate about a mother who lost track of her child at a zoo in Cincinnati and a dead gorilla. The child ended up in a gorilla enclosure and because of the situation, Harambe, the gorilla, was put down for the sake of the child. The issue that is being addressed is not the ethics or who is responsible, but that the mother was unaware where her child was until it was present in the animal enclosure. This is where the Responsibility Tracker comes in. The tracker is designed to be a wearable for the subject in need of tracking. This wearable emits a Bluetooth signal to the parent or guardian's phone or other device that alerts them to a breach in set distance between the subjects. This can also have other uses for keeping track of Alzheimer's and dementia patients that have a tendency to wander.
